

Multiple control panels controlling multiple server ports over a network

AViTA can control multiple server ports over a network. Each control panel has access to a pool of forty server ports from which each workstation can control four. The MCR and QA positions are equipped with a configurable hardware panel with a jog/shuttle wheel, a PC screen and a mouse.

MCR operators use AViTA to quickly search clip lists, build playlists and play out the clips as required. QA operators use AViTA to load, play and edit clips prior to availability for transmission.

The server ports are controlled using an API player protocol directly from the network into the server cluster.
